# List of tables

| No.  | Title of the tables  | Page |
|------|--|------|
| 1    | One-way metric volume (cubic meter) table of Akashmoni and Eucalyptus in different locations   | 40   |
| 2    | One-way metric volume table of Mangium, Sissoo, Mahogany and Raintree in different locations   | 41   |
| 3    | One-way metric volume table of Koroi, Babla, Bokain, Minjiri, Pine and Malacana in different locations                                 | 42   |
| 4    | One-way metric volume table of Arjun, Amm, Jam, Kadam, Kanthal, Neem, Shimul and Pitraj in different locations                         | 43   |
| 5    | One-way metric volume table of Chapalish, Teli garjan, Banderhola, Uriam, Kanak, Civit, Dhakijam, Bahera and Chundul in Natural forest | 44   |
| 6.1  | Two-way metric volume table of <i>Acacia auriculiformis</i> ( Akashmoni) in the plantation   | 45   |
| 6.2  | Two-way metric volume table of <i>Acacia auriculiformis</i> ( Akashmoni) in the woodlot  | 46   |
| 6.3  | Two-way metric volume table of <i>Acacia auriculiformis</i> ( <b>Akashmoni</b> ) in the agroforestry                                   | 47   |
| 6.4  | Two-way metric volume table of Acacia auriculiformis (Akashmoni) in the strip  | 48   |
| 6.5  | Two-way metric Metric volume table of <i>Acacia auriculiformis</i> (Akashmoni) in the embankment                                       | 49   |
| 7.1  | Two-way metric volume table of <i>Acacia mangium</i> (Mangium) in the plantation   | 50   |
| 7.2  | Two-way metric volume table of <i>Acacia mangium</i> (Mangium) in the woodlot  | 51   |
| 7.3  | Two-way metric volume table of <i>Acacia mangium</i> (Mangium) in the agro-forestry  | 52   |
| 8    | Two-way metric volume table of <i>Cassia siamea</i> (Minjiri) in the plantation  | 53   |
| 9.1  | Two-way metric volume table of <i>Eucalyptus Camaldulensis</i> (Eucalyptus) in the cropland  | 54   |
| 9.2  | Two-way metric volume table of <i>Eucalyptus Camaldulensis</i> (Eucalyptus) in the woodlot   | 55   |
| 9.3  | Two-way metric volume table of <i>Eucalyptus Camaldulensis</i> (Eucalyptus) in the agro-forestry                                       | 56   |
| 9.4  | Two-way metric volume table of <i>Eucalyptus Camaldulensis</i> (Eucalyptus) in the strip   | 57   |
| 10.1 | Two-way metric volume table of <i>Swietenia macrophylla</i> (Mahogany) in the cropland   | 58   |
| 10.2 | Two-way metric volume table of Swietenia macrophylla (Mahogany) in the   | 59   |

| No.  | Title of the tables   | Page |
|------|---|------|
|      | embankment  |      |
| 10.3 | Two-way metric volume table of <i>Swietenia macrophylla</i> (Mahogany) in the Home garden           | 60   |
| 11.1 | Two-way metric volume table of <i>Dalbergia sissoo</i> (Sissoo) in the cropland                     | 61   |
| 11.2 | Two-way metric volume table of <i>Dalbergia sissoo</i> (Sissoo) in the strip plantation             | 62   |
| 11.3 | Two-way metric volume table of <i>Dalbergia sissoo</i> (Sissoo) in the embankment                   | 63   |
| 12.1 | Two-way metric volume table of <i>Albizia procera</i> (Korai) in the cropland                       | 64   |
| 12.2 | Two-way metric volume table of <i>Albizia procera</i> (Korai) in the embankment                     | 65   |
| 12.3 | Two-way metric volume table of <i>Albizia procera</i> (Korai) in the central parts                  | 66   |
| 12.4 | Two-way metric volume table of <i>Albizia procera</i> (Korai) in the Home gardens                   | 67   |
| 13   | Two-way metric volume table of <i>Terminalia arjuna</i> (Arjun) in the central parts                | 68   |
| 14.1 | Two-way metric volume table of <i>Samania saman</i> (Rain Tree) in the embankment                   | 69   |
| 14.2 | Two-way metric volume table of <i>Samania saman</i> (Rain Tree) in the Home garden                  | 70   |
| 15   | Two-way metric volume table of <i>Melia azadarach</i> (Bokain) in the cropland                      | 71   |
| 16   | Two-way metric volume table of Accacia nilotica (Babla) in the embankment                           | 72   |
| 17   | Two-way metric volume table of <i>Gmelina arborea</i> (Gamar) in the plantation                     | 73   |
| 18   | Two-way metric volume table of <i>Syzygium grande</i> ( <b>Dhakijam</b> ) in the plantation         | 74   |
| 19   | Two-way metric volume table of <i>Tectona grandis</i> (Teak) in the plantation                      | 75   |
| 20.1 | Two-way metric volume table of <i>Dipterocarpus Turbinatus</i> (Teli Garjan) in the plantation      | 76   |
| 20.2 | Two-way metric volume table of <i>Dipterocarpus Turbinatus</i> (Teli Garjan) in the Natural Forest  | 77   |
| 21.1 | Two-way metric volume table of Artocarpus chaplasha (Chapalish) in the plantation                   | 78   |
| 21.2 | Two-way metric volume table of <i>Artocarpus chaplasha</i> (Chapalish) in the natural forest        | 79   |
| 22   | Two-way metric volume table of <i>Albizia falcataria</i> (Molaccana koroi) in the plantation        | 80   |
| 23   | Two-way metric volume table of <i>Pinus caribaea</i> (Caribbean pitch pine) in the plantation       | 81   |
| 24.1 | Two-way metric volume table of <i>Aphanamixis polystachya</i> (Pitraj) in the natural               | 82   |
| 24.2 | Two-way metric volume table of <i>Aphanamixis polystachya</i> (Pitraj) in the Home garden           | 83   |

# GROWTH, YIELD, VOLUME AND BIOMASS EQUATION AND TABLES FOR IMPORTANT TREES IN BANGLADESH

M.A. Latif and S.M. Zahirul Islam
Forest Inventory Division
Bangladesh Forest Research Institute
P.O. Box No-273, Chittagong 42000, Bangladesh

# **Summary**

A review of growth yield, stem volume and biomass equations and tables for impotent tree species growing in Bangladesh is presented in this document. The mathematical forms of the empirical models, the associated statistical parameters and information about the size of the trees and the country of origin were collated from different scientific articles, bulletins and technical reports. The total number of the compiled equations for growth and yield was 136 (15 different species), for stem volume prediction 705 (39 different species) and biomass estimation 40 (4 different species). The analysis indicated that most of the biomass equations were developed for above ground tree components. The growth and stem volume equations were, in general, based on more representative data covering larger geographical regions. The volume equations were available for major tree species in Bangladesh. The collected information provides a basic tool for estimation of growth and yield rate, stem volume per tree. These information may be used for estimation of carbon stocks and nutrient balance of forest ecosystems across Bangladesh as well as for validation of theoretical models of growth, stem volume and biomass allocation.

**Keywords:** Aboveground biomass, allometry, biomass function, growth and yield, stem volume, tree diameter, tree height

# Introduction

The estimation of growth, stem volume and tree biomass models is needed for both sustainable planning of forest resources and for studies on the energy and nutrients flows in ecosystems. Planners at the strategic and operational levels have strongly emphasised the need for accurate estimates of stem volume, while Hall (1997) reviewed the potential role of biomass as an energy source in the 21st century. In addition, the United Nations Framework Convention on Climate Change and in particular the Kyoto Protocol recognise the importance of forest carbon sink and the need to monitor, preserve and enhance terrestrial carbon stocks, since changes in the forest carbon stock influence the atmospheric CO<sub>2</sub> concentration. Terrestrial biotic carbon stocks and stock changes are difficult to assess (IPCC2003) and most current estimates are subject to considerable uncertainty (Löwe et al. 2000, Clark et al. 2001, Jenkins et al. 2003). The reliability of the current estimates of the forest carbon stock and the understanding of ecosystem carbon dynamics can be improved by applying existing knowledge on the allometry of trees that is available in the form of biomass and volume equations (Jenkins et al. 2003, Zianis and Mencuccini 2003 and Lehtonen et al. 2004). The biomass equations can be applied directly to tree level inventory data

and biomass expansion factors (BEFs) applicable to stand level inventory data can be developed and tested with the help of representative volume and biomass equations (Lehtonen *et al.* 2004).

Recently, remote sensing data have been used to assess standing volume and forest biomass (Montes *et al.* 2000, Drake *et al.* 2002). However, the estimation of biomass depends on ground truth data with measured dimensions of trees, and the empirical biomass equations are therefore needed to predict biomass as a function of recorded variables.

The development of tree growth, stem volume and biomass equations is laborious and time consuming process especially the destructive harvesting of large trees existing equations need to be compiled and evaluated to facilitate identification of the gaps in the coverage of the equations. The compiled equations can also be used to test and compare existing equations with new ones as well as to validate process-based models.

The aim of this study was to develop a database on tree-level tree growth, stem volume and biomass equations for various tree species growing in Bangladesh. Equations for tree growth, stem volume and biomass of different components were considered. The compiled database is a guide to the original publications of these equations. In ecological studies on forest carbon and nutrient cycling, forest and greenhouse gas inventories as well as in the validation of process-based models, this database facilitates effective exploitation of existing information on the allometry of trees.

# **Material and Methods**

The compilation of equations and tables was based on published equations for different tree species growing in Bangladesh. In order to compile the available information we conducted a literature survey on Bangladesh Journal of Forest Science, Bulletins, Mamograph and forest-related journals where published all models, developed by different authors.

The explanatory variables were always the diameter/girth at breast height (D/G), the tree height (H) or a combination of the two. The standardized reference point for breast height and height measurements were from ground level, the stem diameter/girth at breast height have been measured at 1.3 above ground (Bruce and Schumacher 1950, Köhl *et al.* 1997). These two variables (D/G) and H0 are the most commonly used independent variables. In growth equations with several other independent variables (e.g. site fertility, elevation, and soil type) have been also widely developed. Those equations were not, however, included in this database, since selection of variables is highly dependent on local conditions and intended local use of equations. No selection criteria were applied with regard to the species, age, size, site conditions, or sampling method. The compiled tree growth, stem volume and biomass equations were presented according to different tree components as simultaneous equation form.

The measurement units for the regressed and the explanatory variables, the number of sample plots, the number of the sampled trees (n), the coefficient of determination  $(r^2)$ , and the range of diameter and height were also ignored in this review whenever this information was available in the original article.

# Results

# **Stem Volume Equations and Tables**

The total number of the compiled stem volume equations was 705 (Volume equation section) and 41 volume tables (Table 1-41) for ready use with 39 tree species in different locations and position altogether. In general, the total volume of the tree extending from stem collar up to the top of the stems is accounted in the equations developed. Most of the stem volume equations were based on a sample size of several hundred felled trees. In almost every of the compiled stem volume equations the independent variables were D/G for one way and D/G & H for two way with various mathematical combinations. In all the compiled equations the coefficient of determination was more than 0.7 irrespective of species, location, D/G range, site conditions etc.

# **Tree Growth Equations**

All these models for tree species were based on a system of quality classes using as a basic variable the age and dominant height of the population. The total number of the compiled growth and yield equations was 136 (Growth and yield equations section), and they covered 15 tree species in different locations. The independent variables were stand age (A) and tree site index (S) with various mathematical combinations for growth and yield equations. In all the compiled equations the coefficient of determination was more than 0.7 irrespective of species, location, age range, site conditions, etc.

# **Tree Above-ground Biomass Equations**

The biomass equations for various aboveground parts, particularly for stem, branches and leaves & twigs were complied. The total number of the compiled biomass equations for different tree components was 40 and conversion factors was 24 (Biomass equation section). Biomass equations were derived for four tree species namely young eucalyptus, akashmoni mangium and minjiri. The independent variables were D/G for one way and D/G & H for two ways with various mathematical combinations. The coefficient of determination was more than 0.8 irrespective of species, location, D/G range, site conditions for all the complied equations.

# **Discussion**

Assessment of forest biomass and carbon stock is based on information on forest resources i.e. estimates of forested area and volume of the growing stock as reported by national forest inventories (Liski and Kauppi 2000). In national inventories, the volume of the growing stock is estimated with the help of volume equations. The complied results of this study show that representative volume equations are available for major tree species in Bangladesh. The equations presented in this review can be used for national biomass and carbon inventories, for ecological studies, for validating theoretical models and for planning the use of forest resources.

# **Abbreviation**

ln = Natural logarithm (Logarithm on the base e)

G or GBH = Girth at breast height

D or DBH = Diameter at breast height

DomG or DomGBH = Dominant girth at breast height

DomD or DomDBH = Dominant diameter at breast height

BG = Basal girth in centimeter (Basal or Stump girth at about 15 cm above ground level)

SG = Stump girth in centimeter

B or Br = Basal area in centimeter

H or HT = Total height

MHT = Mean height

DomHT or DHT = Dominant height

 $H_{30}$  = Height (Length) up to 30 centimeter top end girth in meter

 $H_{45}$  = Height (Length) up to 45 centimeter top end girth in meter

V or Vt or  $V_{ob}$  = Total volume over bark

 $V_{ub}$  = Total volume under bark

 $V_5$  = Total volume up to 5 centimeter top end diameter

 $V_{10}$  = Total volume up to 10 centimeter top end diameter

 $V_{15}$  = Total volume up to 15 centimeter top end diameter

 $V_{20}$  = Total volume up to 20 centimeter top end diameter

F<sub>ub</sub> =Conversion factor to estimate under bark volume

 $F_5$  = Conversion factor to estimate under bark volume up to 5 centimeter top end girth/diameter from over bark volume

 $F_{10}$  = Conversion factor to estimate under bark volume up to 10 centimeter top end girth/diameter from over bark volume

 $F_{15}$  = Conversion factor to estimate under bark volume up to 15 centimeter top end girth/diameter from over bark volume

 $F_{20}$  = Conversion factor to estimate under bark volume up to 20centimeter top end girth/diameter from over bark volume

L & T = Leaves and twigs

M, m = Meter

Cm, cm = Centimeter

Cum, cum = Cubic meter

Kg = Kilogram

N = Numbers of trees

# **Volume Equations of Important Tree Species**

# 1. Acacia auriculiformis (Akashmoni)
